

# ECE 2799 - Homework 5

---

## Problem - Define Product Changes

At this point in the design process you have no doubt found that there were some errors and omissions in the design approach you selected after your value analysis. Now is the time to **reassess your design** as you know it now, and to **write a more accurate design document**. Further, it's important to not make changes to a design for no particular reason, so now is the time to **justify any changes you have made**.

To complete this homework, you are to write a report which covers the following:

1. An introduction explaining the original design that was selected.
2. A discussion of any errors or omissions that required modifying this original design.
3. A presentation of the revised design, including a new block diagram, details of the various interfaces, the rationale behind any design changes and an analysis showing that the design changes were well thought out and are optimal.
4. A new schedule that reflects the current (final) design from now to the presentation.

The details of your work should dictate the structure of the report. Remember, your report should be well-written, spell checked, and proofread.
